Guide to Install Sophos Home/Endpoint Products on MACOS Sierra 10.12

As per the New update from Apple , the MAC OS V 10.12 would consider Sophos Home/Endpoint as a invalid Software,
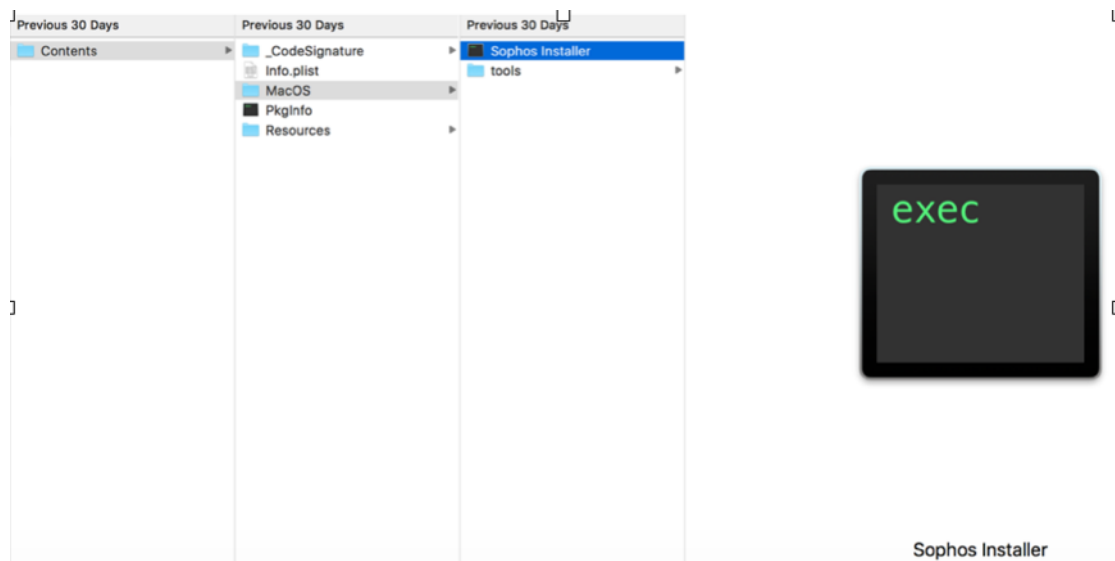

In order to run the installer onto the MAC OS Sierra version you would need to Follow a simple step as you would receive an error "The required configuration file SophosCloudConfig.plist" is missing from the Sophos Installer component folder. The Installer cannot continue "

Step 1: Go to the Installer and right click on the Installer and select "Show Package Contents" as per the snaps [1].

[1]

Step 2: After opening the Package Contents . You would need to Go to Contents > MACOS > Sophos Installer as per the snap [2].
